Binary Recursion, the Universal

Wednesday, August 5, 2020

Intelligence, itself, is determined by a binary distinction denoted by the two words, the perceptible and the intelligible. It is the intelligible binary which is used as a standard by which to judge that the human race, as a whole, is still proto-linguistic. The majority of the human race manages binary in terms of the specific perceptible expressing the fact that they are totally innocent of the intelligible binary by which the entire Universe is constructed, knowable and usable, by that life support system called the mind of man.

The programmable computer is now about eighty years old and if one is familiar with the computer today, they know, are shown every day, that by binary recursion a computer can process all information, in any system of grammar, and be used to control any process or machine, but still, the intelligible of binary appears to escape mankind. What this means is that mankind is not nearly as intelligent as it flatters itself to be.

The idea that all information is processed by binary recursion goes, for the human race, as far back at least as the Bible. Plato taught it as Dialectic and even recognized a geometric line segment as a universal conceptual paradigm by which to follow logical arguments.

Using geometry as a universal binary paradigm by which to pair any logical process has been unavailable to mankind simply because, even though many have tried, including Plato, no one could construct, or figure out, the analog system of grammar using geometry even though its principles are a derivative from the first couple of books written by Euclid. I, myself, have done that work and continue to do the pedantic work on that grammar system. The Analog Grammar of Geometry, can process any logical chain, independent of time as the output of

computation is concurrent with the input. Also, every result is exact, making it independent of every logical grammar system in regard to the precision of that grammar system. One of the brightest aspects of Basic Analog Grammar is the fact that it provides a mind with a visual paradigm that is perfect providing a mind is capable of functioning beyond simple arithmetic information processing available only to simple minded people.

A mind is responsible for virtualising a thing in order to manipulate that thing within a grammar matrix formed as mental processing. A thing is defined as some material difference within limits, form and the material difference within that form. This can also be said as a thing, a unit, a conjugate binary pair, a relative and a correlative, a container and the contained, a map and the territory, absolute and relative, noun and verb, a cup of coffee.

When a mind is not functioning, it manipulates an identical concept arithmetically, not able to see the similar idea in the many examples, as Plato would say; those minds treat each example as a distinct thing unrelated to the class of which it belongs; in short, those minds do not function using geometric information processing also called proportional reasoning and even metaphor. It is a fact, the relative differences that a physical body can detect, the verb, is limited, this means every particular thing denoted as relative constrained by correlatives, are grouped proportional to each other independent of the noun which is used to name that thing, just like in Algebra. Do we not count the exact same way?

We have, by physical fact, and by biological fact, only two concepts to deal with in binary, and only two parts of speech.

Although it should be obvious that every possible system of grammar is used to manipulate one and the same physical environment, or as some would say, reality, this is not part of our education nor part of our social

dialogs, in fact, quite the contrary. It is a universal fact, that all a mind can do to manage information is by binary recursion, unless one can define a unit, a thing, in terms which a mind cannot even imagine.

This being a very provable fact, one has to ask, why is there still no correct grammar books today and why is the whole of mankind still speaking and thinking pure gibberish?

Language is Universal and Intelligible, a simple intelligible binary which by intelligence is used, and used by recursion, to formulate exactly four specific systems of grammar, Common Grammar, Arithmetic, Algebra and Geometry. Grammar systems are constructed by standards of mental behavior derived from the recognition of the intelligible binary which constructs the entire universe, or one can say the whole of reality. Yet mankind is still too stupid to comprehend the implications of this fact, a fact that is right in front of their face from the moment of birth.

Being self-aware is defined in terms of biological fact, a functional mind. A functional mind knows what it is, why it is, and how it does its biologically defined job; therefore, the human race is not, in any wise, self-aware. It is so far asleep, it does not even know what a correct grammar book is.

Let us take a look at the oldest claim I know of that a mind functions, when it functions, by binary recursion. I find this book to be peculiar unto itself among the literature I am familiar with for one reason, it foretells the evolution of the mind of mankind which means that its intelligible origins are not human. As I have been introduced to telepathic communication in my life and have come to understand why its evolution is inevitable it does not phase me that a book written by human hands, a perceptible, means that it was also written by human intelligence, the intelligible. Telepathy is simply an advanced form of communication and it has absolutely nothing to do with mind control, even though on our level of ability it may appear that way.

When I was introduced to grade school, I was amazed at how stupid everyone was; when we have one and only one reality, how is it that we have segregated classes in Common Grammar, Arithmetic, Algebra and Geometry? Each and every one of them is a method of managing the exact same environment, yet we have wholly distinct mythologies for every one of them as if mankind were still living in the wild. Yet, there I was, in school, run by, and attended by, simpletons wholly unaware of the absurdity of their behavior.

I only blend in by trying to keep a very low profile.

Only when the human race can manage simple binary, the simple unit, will human unity evolve from a psychology which functions in terms of that very same unit.

The Bible calls these types of people, Prophets; Plato called them Dialecticians, Confucius called them the Superior Man. I just call it the product of evolution which finally brings intelligence online. Schizophrenia, by biological fact, means a mind processing a thing as being different from itself. Those people who are now engaged in what is called Quantum Computing are at the top of the list of very special schizophrenics, too stupid even to recognized the difference between an operand and an operator, too stupid to recognize that binary recursion, used to formulate every possible form of grammar, can only produce a binary result. By definition, they are paper trained, wholly delusional, idiots. I suggest they sit down with a pencil and paper, and start doing the math, see if it is possible, in any manner, for binary recursion to produce non binary results, or even non-Euclidean Geometry.

As geometry is just another binary system of grammar, the unit being the simplest pairing of the only two concepts which define a unit, stop, go, stop of one's own hand, I would ask any so called non-Euclidean geometry, to draw anything, whatsoever, void of all their gibberish, which is not that very same motion of their very own hand. How stupid can one

be when they do not even know what their own hand is doing? How can you imagine that if they do not know their own hand, they know their own mind?

The very fact that every educational system on the planet is willing to teach gibberish means that there is no factual education today available on a social level. We can produce parrots, but not people: Wonderful.

A species which does not recognize, and utilize, the physical and biological fact, that as every thing is expressed as a binary, and every system of grammar is a method of binary recursion, that species is not linguistically functional. It is factually proto-linguistic also known as illiterate.

Although it is said in the Bible, in the works of Confucius, in the dialogs of Plato, I will defer to a quote from Zenophon:

> "By the Gods, replied Socrates, the discovery will be most useful! The standard of right and wrong once fixed; all difference of opinion among the judges;—all sedition among the people;—all law-suits between citizens;—all wars and contentions among communities, must be at an end! and truly it would grieve me to leave you, Hippias, without knowing what this inestimable secret may be that you say you have discovered." Xenophon, *Memorabilia*, Fielding.

In short, the ills of mankind are due to the simple stupidity produced by the evolution of a mind which is not yet functional; not functionally able to recognize a simple Universal consisting of just two simple states, off and on, assertion and denial, noun and verb. Flatter yourself all you like, with any gibberish you please, but first show me that you are able to just keep track of just two simple Universal and Intelligible concepts. Even a stupid computer can be made to do that. One should not wonder about the power of a computer, but wonder why one is impotent of that very same power. How smart does one have to be to know, for a fact, that we live in a single world and process that world with a single mind, using a single definition of a thing, and not question how stupid their

education and behavior actually is? Education today, is like trying to walk with pebbles in your shoes.
